Find $\iint_S (x^2 + y^2) ds$, where *S* is the lateral surface of the cylinder of radius *a* and height *h* whose axis is the *z*-axis.

Page 1 of 7 June 1, 2016

In Exercises 10-18, let S denote the closed cylinder with bottom given by z = 0, top given by z = 4, and lateral surface given by the equation $x^2 + y^2 = 9$. Orient S with outward normals. Determine

$$\iint_{S} [x, y] \cdot ds$$

In Exercises 19-22, find the flux of the given vector field **F** across the upper hemisphere $x^2 + y^2 + z^2 = a^2$, $z \ge 0$. Orient the hemisphere with an upward-pointing normal.

$$\mathbf{F} = \begin{bmatrix} x^2, & xy, & xz \end{bmatrix}$$

The glass dome of a futuristic greenhouse is shaped like the surface $z = 8 - 2x^2 - 2y^2$. The greenhouse has a flat dirt floor at z = 0. Suppose that the temperature T, at points in and around the greenhouse, varies as

$$T(x,y,z) = x^2 + y^2 + 3(z-2)^2$$
.

Then the temperature gives rise to a **heat flux density field H** given by $\mathbf{H} = -k\nabla T$. (Here k is a positive constant that depends on the insulating properties of the particular medium.) Find the total heat flux outward across the dome and the surface of the ground if k = 1 on the glass and k = 3 on the ground.

Verify Stokes's theorem for the surface and vector field

S is defined by $x^2 + y^2 + z^2 = 4$, $z \le 0$, oriented by downwards normal;

$$\mathbf{F} = \begin{bmatrix} 2y - z, & x + y^2 - z, & 4y - 3x \end{bmatrix}$$

In Exercises 6-9, verify Gauss's theorem for the given three-dimensional region D and vector field \mathbf{F} .

$$\mathbf{F} = [x, y, z],$$

$$D = \{(x, y, z) \mid 0 \le z \le (9 - x^2 - y^2)\}$$

6. If *S* is the unit sphere centered at the origin, then $\iint_S x^3 dS = 0$.

10. $\iint_{S} [-y, x] \cdot d\mathbf{s} = 0$, where *S* is the cylinder $x^2 + y^2 = 9$, $0 \le z \le 5$.

18. $\iint_S \nabla \times \mathbf{F} \cdot d\mathbf{s}$ has the same value for all piecewise smooth, oriented surfaces S that have the same boundary curve C. *Hint:* think about what the field is doing.
